

Network Pack

BROADBAND INTERNET CONNECTION

ADSL installed to your existing network

Engineer install

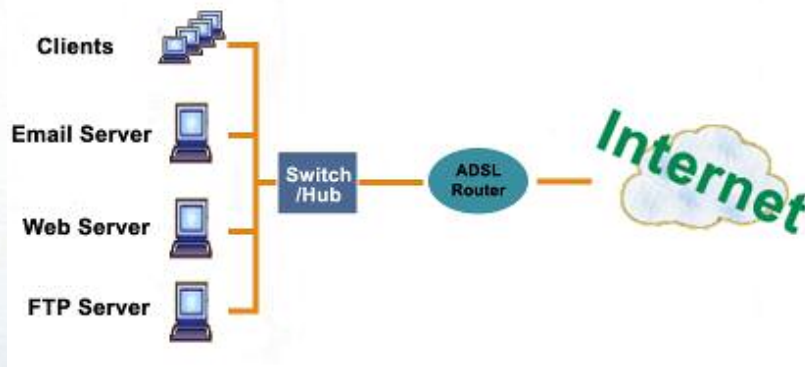

An engineer will set up your broadband for you. Using a router supplied by us, the engineer will attach the router to your phone socket and computer and test that the connection is working satisfactorily.

Broadband connected to network

The engineer will then install broadband on your network. This involves configuring the router to the range of IP addresses used by your network, installing the modem on the server and testing that the connection is working satisfactorily on each machine on the network.

Network with an ADSL router and a server

Network with an ADSL router and a hub

Network Management

Policy Based Networking solutions that improve the performance and ensure the quality of mission critical and time-sensitive applications running on IP networks. Our range of products allow network managers to define relationships between organisational needs and network infrastructure, in order to achieve maximum efficiency from network and server resources. Network managers can track, account and bill for network usage according to the same policies that define and enforce network bandwidth allocation. Advanced tools provide capabilities for reporting on account activity, analysing specific application-level traffic flows as well as long-range traffic usage patterns.
